GadPortfolio — Test Log

My name is Gad Niyibigira.

App: GadPortfolio
Registration number: 25/26951
Verification code: MOB-A2-6951
Test device: Samsung Galaxy A04e
Android version: Android 14
Test date: 11 October 2026
Build tested: EAS preview APK, commit 586846a
Tester: Gad Niyibigira

Test environment
The tests below were performed on the installed APK — not on the development server, and not in Expo Go. The APK was installed by enabling "Install unknown apps" for the file manager on the test device, then opening the APK file directly.

Device: Samsung Galaxy A04e
Android version: Android 14
Install method: Direct APK install (sideloaded)
Network state: Wi-Fi on for tests 1–6 and 8; Airplane Mode on for test 7
Screen size: 6.5 inches, narrow-screen layout
System font size: Default (100%)

Test cases

Test 1 — App launches without Expo Go
Steps: Install the APK. Tap the app icon.
Expected: App opens directly to the Home screen without opening Expo Go or the development menu.
Actual: App opened directly to the Home screen. The required sentence "My name is Gad Niyibigira." was visible on the hero.
Status: PASS

Test 2 — Profile save survives app restart

Steps: Edit the professional headline on the Profile tab. Tap Save. Force-close the app from the recent apps list. Reopen it.
Expected: The edited headline is still shown on the Profile screen and reflected on the Home tab.
Actual: The headline persisted after the restart. The Home tab reflected the new headline.
Status: PASS

Test 3 — Gallery image selection
Steps: Profile tab, tap "Choose from gallery", grant permission, select an image.
Expected: The image appears as a preview on the Profile screen and as the hero image on the Home tab after saving.
Actual: Image was selected, copied into the app's durable directory, and appeared on Home after saving. The image also persisted across an app restart.
Status: PASS

Test 4 — Camera capture
Steps: Profile tab, tap "Take photo", grant camera permission, take a photo, accept.
Expected: The captured photo appears as the preview and persists after saving.
Actual: Camera opened, photo captured, preview shown, saved successfully.
Status: PASS

Test 5 — Skills add, edit, delete
Steps: Skills tab, tap "＋ Add a new skill", enter a name, choose a level, choose a category, pick an icon, tap Save. Then tap the new card to edit. Then delete it.
Expected: The new skill card appears in the grid immediately and persists after restart. Edit and delete behave the same way.
Actual: Skill was added, edited, and deleted as expected. Changes persisted across app restart.
Status: PASS

Test 6 — Photography: add a photo
Steps: Photography tab, tap "＋ Add a photo", choose Gallery, select a photo, enter a title and category, tap Add photo.
Expected: The photo appears in the masonry grid with its title and category overlay. Tapping it opens the detail sheet. Long-press removes it.

Actual: Photo was added and appeared in the masonry grid at its true aspect ratio. Detail sheet opened on tap. Removal worked via long-press confirmation.
Status: PASS

Test 7 — Airplane Mode operation
Steps: Enable Airplane Mode from the device's quick settings. Open the app. Visit every tab: Home, Skills, Projects, Photography, Profile. Open a Project Detail screen.
Expected: Every core feature works offline. No error messages, no missing content, no network requests required.
Actual: All tabs and the Project Detail screen worked normally. No network errors. The device clock was visible in the status bar.
Status: PASS

Test 8 — Android Back from Project Detail
Steps: Projects tab, tap the "Student Management System" card to open Project Detail. Perform the Android Back gesture.
Expected: The app returns to the Projects tab and preserves the tab state.
Actual: The app returned to the Projects list. Tab state was preserved.
Status: PASS

Additional verification
All 8 tests passed on the first run. No tests failed. No features were left untested on the tested platform.

Device storage after testing: the profile image, three added skills, and one added photo all persisted correctly across multiple app restarts.

Known platform limitations
The Expo web preview (npx expo start --web) cannot run the image picker or the camera. This is a limitation of React Native Web, not of GadPortfolio. All image-related tests above were performed on the installed Android APK.

The app is distributed as a sideloaded APK, not through the Google Play Store, as required by the assignment.

Declaration

The tests above were performed by me on the device listed. The results recorded are accurate and unedited. I did not use Expo Go for any of the tests above.
